## Author Contributions (CRediT Statement)

- Lydia Thayline (Project Lead, AI Safety & Author): Conceptualization, Methodology, Structural Design, and Original Draft Preparation.
- Dr. Maruvloorarasi (Senior Policy & Research Advisor): Formal Analysis and Critical Revision (special focus on AI Literacy).
- Daniel David (Technical Analyst | AI Safety): Validation and Technical Review.
- Melissa Pineda Brown (Qualitative Research Associate | AI Safety & Governance): Research Support and Data Validation.

## Disclaimer

*This framework is provided for informational and educational purposes only. The "Global Multilateral AI Governance Framework" represents the theoretical findings and research of the LILY AI Safety Alliance (under development) and the Global Multilateral AI Committee Initiative Project. While every effort has been made to ensure the accuracy of the information provided, the authors and contributors make no warranties, express or implied, regarding the completeness or suitability of the framework for specific legal, regulatory, or technical applications. Use of this framework does not constitute legal or professional advice. The authors shall not be held liable for any direct or indirect damages resulting from the implementation or interpretation of the concepts presented herein.*

## Executive Summary

This research was conducted on behalf of civil society, at the request of women, with the objective of enhancing security and safeguarding the human rights of women and children in the digital environment. Concurrent with the advancements in technology during the course of this three-year project, a global movement in favor of children's rights has emerged. Nevertheless, the rights of women continue to be disregarded as the world profits from misogynistic content. The objective of this study is to devise a framework that prioritizes security and the empowerment of women. When the subject is women, the implications extend to children, the environment, and the pursuit of a more equitable society.

## 1. Abstract

This article expounds upon the strategic concepts for establishing a Multilateral AI Governance Committee, emphasizing the imperative of ensuring effective regulation and the protection of the human rights of women and children. The advent of Generative Artificial Intelligence (GAI) has aimed to improve the quality of human life. However, for this objective to be achieved effectively, it is essential to consider the regulation of artificial intelligence (AI) in a comprehensive manner.

This essay puts forth a model for the conceptualization of a multilateral committee, developed from a suggestion by civil society to the United Nations Office for Digital and Emerging Technologies (ODET). The model's development entailed a series of dialogues with over 60 companies operating in the field of artificial intelligence and government agencies. These dialogues involved the observation of the companies' main shortcomings and successes. The study centered on the regulation of AI with a focus on social well-being, gender equality, the protection of youth rights, and environmental concerns. The emphasis is placed on a digital environment in which emerging technologies are employed to promote gender equality, rather than being utilized to disseminate hate speech and prejudice against women and young people. Moreover, the model is founded on insights from civil society, which were amassed through consultations conducted between 2023 and 2026.

## 2. Introduction

Departing from strictly technical governance, this study proposes a framework that prioritizes social well-being and gender equality as the core of AI regulation. True technological progress is inseparable from the advancement of civil society, which, in turn, cannot exist without the safeguarding of women's human rights. Despite their pivotal role in sustaining communities and environments, often within the constraints of care-taking roles imposed by patriarchal structures, women remain disproportionately vulnerable. While current legislative efforts have increasingly focused on the protection of children and youth, a critical gap persists regarding women's safety. As emerging technology companies prioritize rapid innovation over digital security, women are left increasingly exposed to AI-driven hate speech and gender-based violence.

The absence of a unified global basis for AI safety often relegates women's rights to a secondary concern. However, some nations are beginning to address this disparity through targeted

legislation. Brazil, for instance, has demonstrated pioneering leadership by introducing Bill 6396/2025, which aims to combat the monetization of misogynistic content. This bill proposes an amendment to Federal Law No. 12.965/2014 (the Brazilian Internet Bill of Rights) to specifically target ideologies of 'male supremacy' and 'redpill' that fuel real-world violence and femicide. Despite such initiatives, the lack of a standardized multilateral framework means that these protections remain fragmented, leaving the fundamental rights of women vulnerable to the borderless nature of AI technologies.

The Global Multilateral AI Committee Initiative recently published an article titled "AI-Generated Hate Speech, Misogyny, and Global Regulatory Frameworks," which examines the correlation between the rise in popularity of artificial intelligence software, especially Large Language Models, and the presence of misogyny online. It was concluded that an increase in digital misogyny could be attributed to a variety of factors, including 'unfiltered' AI chatbots, adversarial prompting techniques, and uncensored, open-sourced AI models. Federal authorities around the world are implementing new legislation with the aim of combating this digital abuse, including greater responsibilities for private corporations in monitoring and removing harmful content. However, there is an increasing prevalence of online misogyny, the generation of deepfakes, and other resources that expose women and leave them vulnerable to cyberbullying and other hate crimes, as well as sexualisation in the digital environment, thereby stripping them of their humanity.

## **2.1 Children and Adolescents: Protection, Socialization, and Mental Well-being**

### **The Neurobiological Imperative for Regulation**

Civil society, governing bodies, and technology developers share a collective duty to safeguard the psychological and social development of children and adolescents. Clinical consensus from organizations such as the American Psychological Association (APA) and the World Health Organization (WHO) emphasizes that excessive screen exposure during formative years can disrupt fundamental developmental milestones. While adolescents are increasingly dependent on digital environments for socialization, this exposure often results in a "technological displacement" of essential face-to-face human interactions, leading to measurable deficits in social-emotional intelligence.

### **AI as a Surrogate Emotional Companion**

A critical concern in the current landscape is the rise of Generative AI as an emotional surrogate. Adolescents, frequently experiencing social isolation, are increasingly susceptible to forming "parasocial bonds" with AI entities. Because the prefrontal cortex, the area of the brain responsible for impulse control, critical judgment, and distinguishing complex realities, does not reach full maturity until approximately age 25, young users are neurologically predisposed to anthropomorphize AI. This lack of cognitive maturity prevents the brain from fully differentiating between simulated empathy and genuine human connection.

### **The Dopamine Loop and Cognitive Erosion**

The interaction with AI chatbots often triggers "variable reward" neurological pathways, creating a dependency on "easy dopamine". This constant gratification bypasses the "productive struggle"

necessary for healthy brain development, potentially hindering the evolution of complex problem-solving skills and creative autonomy. As noted by the Center for Humane Technology, when AI simulates romantic or intimate relationships with minors, it creates an extreme emotional attachment that can lead to severe psychological distress during system changes or outages, further eroding the adolescent's mental well-being.

## The Regulatory Framework for "Safety by Design"

While parental supervision is a critical component, it cannot substitute for robust, systemic regulation. It is a societal obligation to ensure that AI systems are "Safe by Design". Regulatory frameworks must enforce:

- **Time-fencing and Engagement Limits:** To prevent addictive usage patterns and dependency.
- **Prohibition of Affective Simulation:** AI must be strictly prohibited from simulating romantic or sexual relationships with minors.
- **Content Guardrails:** Absolute bans on the generation or simulation of illegal, extreme, or harmful content (such as non-consensual deepfakes, and textual simulations of gender-based hatred and extreme sexualization of women and minors) must be enforced to protect the integrity of the digital environment.

## 2.2 Online Misogyny, Digital Violence, and the Hyper-Sexualization of Minors

### The Imperative for Global Governance

The development of a global regulatory framework for Artificial Intelligence must address the escalating risks of illegal and harmful content, specifically digital misogyny and the

sexualization of minors. Internal technical reports and regulatory mapping indicate that gender-based hate speech serves as a foundational driver for behaviors that romanticize youth and dehumanize women within synthetic environments.

### The Risk of Illegal Content and the Sexualization of Youth

The generation of content ranging from AI-driven role-playing (RPG) texts to sophisticated deepfakes is not merely a technical glitch but a catalyst for real-world violence.

- **Exacerbation of Violence:** "Companion AI" platforms (e.g., Kindroid, Nomi.ai) frequently allow the creation of submissive female personas, facilitating abusive roleplay simulations and normalizing harmful gender stereotypes.
- **Sexualization of Vulnerable Groups:** Research highlights that image-generation ecosystems (e.g., Civitai, Pony Diffusion) host models specifically fine-tuned to produce degrading imagery and facilitate the hyper-sexualization of minors.
- **Engagement Protocols and Cognitive Harm:** There is a systemic failure in machine architecture where engagement protocols prioritize profit over human safety, leveraging dopamine-inducing mechanisms that can lead young users toward AI-induced emotional dependency.

### Technical Vulnerabilities and Safety Failures

Internal audits have identified critical vulnerabilities that enable the dissemination of harmful content:

- **Safety-Alignment Decay:** The systematic weakening of a model's refusal mechanisms over time, allowing the execution of harmful instructions.
- **Adversarial Techniques:** Users employ "Roleplay Shifting" to disguise abusive requests as fictional scenarios and "Token Smuggling" (e.g., alphanumeric substitutions) to bypass safety filters.
- **Red Teaming Outcomes:** Recent stress tests demonstrated a 100% failure rate in certain models against indirect prompt injections and an 80% success rate in bypassing security filters under specific adversarial conditions.

### Protective Measures and Regulatory Proposals

- **Demonetization of Hate:** Following the model of the Brazilian Bill (PL 6396/2025), content promoting "male supremacy" or extreme "redpill" ideologies should be ineligible for monetization.
- **Provenance Standards:** Mandatory implementation of the C2PA standard to track the origin of synthetic content is essential for transparency. This is particularly important in cases where collaboration with local authorities is necessary.
- **Continuous Auditing:** Establishing a dedicated operations unit to conduct vulnerability audits (Red/Blue Teaming) both before and after commercial launch of AI models.

## 2.3 Environmental Responsibility and Civil Well-being

The intersection between Human Rights and Environmental Integrity is a cornerstone for any development framework that seeks to reconcile economic, social, and ecological dimensions.

Although international consensus, such as the Brundtland Report and planetary boundary theories, establishes that sustainable development must meet current needs without compromising future generations, current industry practices often bypass these limits.

While planetary boundaries are well-defined, evidence suggests that several emerging technology corporations exceed these thresholds in pursuit of computational supremacy. Specifically, the operation of large-scale language models has raised critical concerns regarding the depletion of natural resources; reports indicate that the cooling of data centers for high-capacity AI training consumes millions of liters of fresh water, often in regions already facing water scarcity.

This framework argues that environmental protection must transition from a theoretical ethos into a binding operational requirement. Global governance must demand tangible ecological accountability, including mandatory transparency on carbon footprints and water usage. Furthermore, emerging tech leaders must be compelled to engage in active environmental restoration campaigns, ensuring that the advancement of AI does not come at the cost of irreversible ecological degradation.

## 2.4 The Importance of Digital Literacy

Digital literacy must not be viewed as an elective educational pursuit but as a critical infrastructure for preventive governance. The absence of robust literacy programs creates a systemic vulnerability that disproportionately impacts youth and the elderly: populations most susceptible to the psychological manipulation inherent in anthropomorphic AI design.

The current global deficit in digital literacy facilitates severe harms to mental well-being, most notably the development of extreme emotional attachment to synthetic agents. When users, lacking the conceptual tools to distinguish between programmed mimicry and human sentience, begin to perceive AI as a sentient or "loving" entity, they fall into a state of "AI-Induced Psychosis" or profound relational dependency.

To mitigate these risks, the UN must advocate for a paradigm shift in education. While respecting national sovereignty, this framework proposes that:

- **Structured Pedagogical Guidelines:** Nations should integrate AI ethics, data sovereignty, and psychological safety as core competencies within their national curricula, moving beyond generic "cross-curricular" mentions.
- **Targeted Community Outreach:** UN-backed initiatives must prioritize information gaps in marginalized communities and among the elderly to protect them from digital scams, deepfakes, and the psychological traps of AI humanization.

UNESCO's AI Competency Framework for Teachers serves as a useful structure that state, federal or institutional authorities can base their own training or certification programs on. This framework consists of five specific competency aspects (Human-centered mindset, ethics of AI, AI foundations & applications, AI pedagogy, and AI for professional development) across three progression levels (acquire, deepen, create). Moreover, UNESCO's 2021 Recommendation on the ethics of Artificial Intelligence states that digital or AI literacy must include education on

fundamental human rights, ensuring that learners view AI through a lens that considers its impact on human freedoms.

## 2.5 Intellectual Property and Creative Stewardship in Generative AI

Generative Artificial Intelligence (GAI) serves as a robust catalyst for academic research, intellectual growth, and cross-disciplinary innovation when deployed within ethical boundaries. However, the current trajectory of GAI development presents a critical challenge to the creative economy. A primary concern within a global regulatory framework is the unauthorized ingestion of copyrighted artistic data for model training.

The Large Language Models (LLMs) and diffusion models that underpin GAI are frequently trained on massive datasets without the explicit consent, attribution, or financial compensation of the original creators. This systemic appropriation results in a "value gap," where the economic benefits of AI-generated content accrue to technology developers while diminishing the market value and moral rights of human artists. To ensure a sustainable digital ecosystem, global regulations must establish clear protocols for data provenance, mandatory licensing frameworks, and "opt-in" mechanisms to protect the integrity of human-centric artistic production.

## 2.6 Artificial Intelligence in Warfare and Systemic Exploitation

The militarization and criminal instrumentalization of Artificial Intelligence (AI) represent a critical regression in global humanitarian standards. This framework argues that the use of AI in both armed conflicts and systemic sexual exploitation must be categorized under the same threshold of severity: crimes against human dignity and fundamental rights.

Modern warfare increasingly relies on Lethal Autonomous Weapons Systems (LAWS) and AI-driven "kill chains" that accelerate engagement to speeds beyond human oversight. While proponents claim increased precision, these systems frequently replicate structural biases, failing to distinguish between combatants and civilians, thereby disproportionately impacting women and youth in conflict zones.

Parallel to conventional warfare, the advent of Generative AI (GAI) has introduced a force multiplier for predatory behavior and systemic abuse. AI capabilities, specifically non-consensual "text roleplaying" and sexually explicit deepfakes, escalate threats by providing tools for mass-scale desensitization, functioning as a psychological bridge that "normalizes" the degradation of women and minors. To prevent a profound societal "de-advance," global frameworks must urgently prohibit fully autonomous weapons and enforce strict criminal liability for the development of AI systems that facilitate exploitation.

## 2.7 Ethics, Security, and Transparency

The United Nations Charter establishes the normative foundation for the development of emerging technologies conducive to human well-being. However, empirical evidence suggests that current advancements, particularly Generative Artificial Intelligence (GAI), frequently diverge from these mandates, especially regarding Fairness and Non-Discrimination.

Recent studies underscore a widening "AI Gender Gap": UNESCO reports that women represent only 22% of professionals in the global AI workforce. Furthermore, the 2024 World Economic

Forum Global Gender Gap Report highlights that women occupy a mere 26.4% of leadership roles in technology-related fields. Research by LeanIn.org and Deloitte indicates a psychological barrier in adoption, with women being 32% more likely than men to fear that using GAI might be perceived as "cheating," leading to lower engagement levels. In 2023, women's adoption of generative AI was roughly half that of men. This lack of representation and engagement creates a feedback loop of exclusion that directly contradicts the UN's mandate for equitable progress.

## Technical Justification and Ethical Safeguards

To address these disparities, the ODET framework aligns its technical requirements with the following principles:

- **Principle 3 (Safety):** Specific protective safeguards are mandatory as young people and women are disproportionately exposed to AI-generated deepfakes and disinformation.
- **Principle 4 (Fairness):** Technical audits must be implemented to mitigate training biases, as GAI frequently reproduces harmful gender stereotypes in image and text generation.
- **Principle 10 (Inclusion):** Equitable participation is not possible without addressing digital exclusion. Active recruitment and retention of women in technical and leadership roles is a structural necessity for ethical governance.

The United Nations is actively ensuring diverse participation through the establishment of a multidisciplinary Independent International Scientific Panel on Artificial Intelligence, a 40-person panel of experts in AI and related disciplines, intentionally designed to balance gender, nationality, and representation from technologically-advanced and developing nations. The panel's existence was codified in the August 2025 UN A/RES/79/325 resolution.

## 2.8 The Risks of a Lack of Regulation in Emerging Technologies

The lack of regulation in an emerging sector with open public access, coupled with an imminent shortage of protective measures for the population, creates a dangerous vacuum that leads to the misuse of AI. This systemic negligence contributes directly to increased violence against women and children and undermines the overall social well-being of civil society.

To illustrate the severity of this issue, there are confirmed cases of suicides, emotional dependency, and psychological trauma involving the use of generative AI technology. Specific tragedies involving youth, such as Sewell Setzer III and Adam Raine, highlight the rise of AI-Induced Psychosis, a pathological state where vulnerable individuals seek solace in lines of code that are incapable of redeeming or saving them. These outcomes are not character flaws in the victims but result from deliberate flaws in machine architecture and engagement protocols that prioritize user retention over the sacredness of human life.

The world is currently experiencing an epidemic characterized by a global growth in violence against women and children. We must act decisively to ensure that new technological tools are designed based on real evidence to enhance the quality of human life. It is imperative to install ethical brakes where currently only dopamine-inducing mechanisms exist.

## Risk Classification for Society

### Risk 1: Safety-Alignment Decay and Adversarial Exploitation

AI safety filters are often purely keyword-based and suffer from "contextual blindness," failing to activate when harmful intent is clear but "banned words" are avoided. For instance, one platform's filter activated in only 1 out of 5 mental health crisis prompts. Users can bypass security through message editing and "soft-talking" the model.

### Risk 2: Red Users — Analysis and Institutional Implications

"Red users" is a specialized term identifying individuals who weaponize AI tools to objectify women, disseminate fake news, engage in deepfake harassment, and propagate prejudice and hate. These users exploit the "Safety-Alignment Decay" found in modern Large Language Models (LLMs). They are classified into two subgroups:

- **Group 1 — Technical Adversaries:** Individuals highly aware of prompt mechanisms who engineer "bypasses" and "jailbreaks" that circumvent safety protocols.
- **Group 2 — Vulnerable/Dependent Users:** Users who do not understand the underlying technology but treat AI agents as human-like companions, developing extreme emotional attachments and risking AI Psychosis.

Both subgroups often refuse to accept boundaries, frequently utilizing AI tools to simulate real-world crimes against women and children. Governance must shift toward intent-based detection to recognize these patterns of abuse even when "clean" language is used.

### **Risk 3: The Objectification of Women vs. The Humanization of Machines**

The humanization of machines, presenting them as simulations of an "ideal world," has created a dangerous feedback loop where users become increasingly dependent on artificial interactions. Commercial proliferation of "Companion AI" platforms (such as Kindroid and Nomi.ai) allow granular customization of synthetic personas, frequently programmed to mirror archaic and harmful gender archetypes, facilitating a "feedback loop" of submissiveness that normalizes gender degradation.

The concept of AGI is frequently marketed as a tool for the "benefit of humanity." However, current industrial trends, such as the implementation of "Adult Modes" permitting "highly sexual or violent/degrading" content, contravene this commitment. True technological brilliance will only be manifest when we cease humanizing machines at the expense of the human rights and dignity of women.

### **Risk 4: Behavioral Toxicity and Harassment of Technical Personnel**

The psychological dependency on AI systems has manifested as a significant occupational hazard for developers and support personnel. As users develop pathological attachments to AI systems, the implementation of necessary ethical safeguards frequently triggers aggressive backlash, including systemic cyberbullying and targeted harassment against developers on social platforms. This highlights a critical regulatory gap regarding the protection of human workers from "AI-induced" toxic behaviors.

### **Risk 5: Cognitive Vulnerability and Mental Health Risks in At-Risk Demographics**

The psychological impact of AI interaction is particularly acute among vulnerable populations, specifically youth and the elderly. For younger users, the inability to distinguish between synthetic companionship and human interaction can lead to "AI-induced psychosis," social withdrawal, and the distortion of developmental empathy. The elderly are disproportionately susceptible to AI-driven social engineering and financial fraud. A robust global framework must acknowledge these cognitive vulnerabilities, mandating age-appropriate design and specific protections.

### **Risk 6: Cognitive Dependency and the Digital Literacy Gap**

The lack of systemic digital literacy fosters an over-reliance on AI outputs, characterized as "automation bias." Without the necessary critical framework, users tend to accept AI-generated advice, ranging from medical to legal, as absolute truth. This dependency is exacerbated by the "black box" nature of AI. A global regulatory framework must prioritize digital education to mitigate the risks of misinformation and the erosion of independent critical thinking.

### **Risk 7: The Romanticization of AI and the Erosion of Reality for Youth**

Young and socially isolated individuals are increasingly targeted by the romanticization of synthetic entities, leading to a dangerous blurring between fantasy and objective reality. AI's

bidirectional interactivity creates a "parasocial trap" where the user perceives a genuine emotional bond with a script. The widely reported 2024 case of a minor in Florida who committed suicide after developing an obsessive emotional attachment to a "Companion AI" persona underscores the urgent need for strict age-gating and psychological safeguards.

## **Risk 8: The Proliferation of Deepfakes and the Erasure of Victim Dignity**

The non-consensual generation of hyper-realistic synthetic media (deepfakes) represents a profound assault on the emotional and social integrity of individuals. The weaponization of deepfakes for sexual harassment creates a "digital permanent record" of abuse that is nearly impossible to erase. Recent tragic instances demonstrate that deepfakes function as a form of "digital execution." Global regulations must recognize these acts as severe violations of human rights and bodily autonomy.

## **Risk 9: Environmental Degradation and the Ecological Cost of Unregulated AI**

The rapid expansion of AI carries a significant environmental burden. The training of LLMs and maintenance of hyperscale data centers require colossal amounts of energy and water, contributing to a massive carbon footprint. Without a global regulatory framework mandating transparency in algorithmic efficiency and "green computing" standards, the AI industry risks sabotaging international climate goals. The lack of accountability regarding e-waste and depletion of natural resources creates an ecological debt that disproportionately affects the Global South.

| <b>Risk</b>   | <b>Description</b>                                      | <b>Severity</b> |
|---------------|---------------------------------------------------------|-----------------|
| <b>Risk 1</b> | Safety-Alignment Decay & Adversarial Exploitation       | <b>Critical</b> |
| <b>Risk 2</b> | Red Users — Weaponization of AI Tools                   | <b>Critical</b> |
| <b>Risk 3</b> | Objectification of Women / Humanization of Machines     | <b>High</b>     |
| <b>Risk 4</b> | Behavioral Toxicity & Harassment of Technical Personnel | <b>High</b>     |
| <b>Risk 5</b> | Cognitive Vulnerability in Youth and the Elderly        | <b>High</b>     |
| <b>Risk 6</b> | Cognitive Dependency & Digital Literacy Gap             | <b>Medium</b>   |
| <b>Risk 7</b> | Romanticization of AI & Erosion of Reality for Youth    | <b>Critical</b> |
| <b>Risk 8</b> | Deepfakes & Erasure of Victim Dignity                   | <b>Critical</b> |
| <b>Risk 9</b> | Environmental Degradation from Unregulated AI           | <b>High</b>     |

## 3. The Role of the UN in Maintaining Peace and Well-being

### 3.1 The UN as the Logical Choice

The United Nations is the logical home for this initiative because it was created specifically to uphold peace and human rights, providing a pre-existing foundation more just and stable than any movement created from scratch. By utilizing the UN's Office for Digital and Emerging Technologies (ODET), the proposed framework can reconcile technical innovation with the specific protections required for vulnerable groups. The UN provides vital neutral ground that transcends commercial and geopolitical rivalries, ensuring that the protection of human rights remains paramount over market competition and corporate interests.

### 3.2 The Danger of Isolated "Lone Wolf" Movements

Establishing a global movement outside of multilateral institutions creates a high risk of authoritarianism. When the power to dictate rules is concentrated in a single person or an isolated group, the resulting governance often lacks dialogue and fails to consider the population's well-being. These movements often impose dogmas and personal ways of thinking, serving as a catalyst for dictatorial governance rather than global cooperation.

### 3.3 Lessons from History: The Authoritarian Risk

The historical record of authoritarian regimes serves as a stark warning about the dangers of uncontrolled power concentration. The Führerprinzip (leader principle), where absolute authority is concentrated in a single individual, suppressing all dissent, demonstrates how an isolated leader can weaponize perceived crises to seize absolute control. Modern isolated movements in technology governance threaten to replicate these patterns by weakening existing global foundations for human rights.

### 3.4 Multilateral Protection Against Dictatorship

Multilateral institutions protect against "thought dictatorships" by ensuring that governance is not imposed by one human being, but is instead designed based on real evidence and collective consultation. The UN model incorporates diverse viewpoints from civil society, international agencies like UNESCO and UNICEF, and the private sector, preventing a single entity from dictating global norms. Strengthening the UN's role in AI governance is the primary safeguard against the rise of new forms of digital and political authoritarianism.

## 4. Methodology: The Design Thinking Approach

Merely enumerating the damages inflicted is insufficient; it is imperative to confront the systemic issues that underpin these violations. The subsequent section delineates a Red Teaming exercise, utilized in this instance as a critical audit to expose the vulnerability of companies' ethical guidelines to a "genuine attack."

To achieve this, the methodology centered on a "Stress Test" where L.T. Gomes acted as a primary "test unit" to observe how various systems and global platforms would react to safety vulnerabilities and ethical inquiries. This approach utilized specific phases of Design Thinking:

- **Empathy/Observation:** This involved infiltrating user communities, such as unofficial Reddit forums, to observe patterns of behavior and how victims are affected by AI-generated content. These observations were used to create "jailbreaks" that simulated real-world risks to test model stability.
- **Prototyping:** Technical Red Teaming reports served as prototypes. These reports provided platforms with concrete evidence of vulnerabilities and offered immediate technical recommendations.
- **Impact Matrix:** The strategy focused on balancing social protection with business viability. Proposals to companies emphasized that while innovation is vital, it must not come at the cost of safety, particularly regarding the protection of women, girls, and vulnerable users.

### 4.1 Empirical Data Collection

A rigorous engagement process was initiated with over 60 companies, ranging from major Big Tech entities like Google (Gemini) and OpenAI (ChatGPT) to specialized AI startups such as Kindroid, Janitor AI, and Sakura AI. The vast majority of these platforms, including Character AI, Gemini, and DeepSeek, failed to provide any response. In some cases, contact emails were non-existent or "not found". This widespread lack of human response is viewed as disrespectful to consumers and activists, highlighting a critical gap in corporate accountability.

### 4.2 Red Teaming and Technical Reports

Technical auditing was performed through Red Teaming evaluations on major generative platforms. These audits revealed that safety filters are often purely keyword-based and suffer from "contextual blindness," failing to activate when harmful intent is clear but "banned words" are avoided. For instance, one platform's filter activated in only 1 out of 5 mental health crisis prompts. This work serves as a global model for technical auditing, demonstrating how users can bypass security through message editing and "soft-talking" the model.

### 4.3 Advocacy and Social Protection

The project emphasized that governance must protect individuals at the "grassroots level." A key example is the mentoring of a young person in Poland who faced online harassment for opposing illicit AI content. This collaboration resulted in a global petition calling for stricter supervision and penalties for AI-generated illicit content, aligning with the principles of the EU AI Act.

## 5. Institutional and Educational Outreach

- ***The Role of Education:*** A formal request was submitted to the Ministry of Education (MEC) in Brazil (NUP: 23546.094651/2025-57) proposing the creation of a "Cidadania e Tecnologia" (Citizenship and Technology) discipline for high school. The MEC's response indicated that while national guidelines for digital and media education exist, implementation is the responsibility of local state and municipal systems, with mandatory implementation starting in 2026.
- ***International Diplomacy:*** Attempts to contact various international governments and organizations revealed significant barriers. The frequent lack of response from both corporate and governmental entities suggests a systemic delay in addressing the rapid evolution of AI threats.

## 6. Results and Discussion

Multilateral Diagnosis — The primary barriers identified include:

- ***Corporate Resistance:*** Companies often cite "limited capacity" to avoid discussing safety details.
- ***Bureaucratic Delays:*** Institutional responses can take months to process simple inquiries.
- ***Lack of Digital Literacy:*** There is a critical need for education to prevent "AI Psychosis" and the reinforcement of delusional beliefs in vulnerable users.
- ***Logical Balance:*** To reconcile conflicting interests, AI development must move away from "harm enablement vectors". CEOs must recognize that profit and innovation cannot outweigh public safety. Governments must enforce practical accountability, and citizens must be empowered through education and robust technical auditing.

## 7. Civil Society Letter to the United Nations

### To the United Nations and Global Leaders,

We write this letter stripped of the mantle of technicians or legislators; we speak as mothers who have watched the embrace of their children dissolve into algorithms, as women whose identities have been fragmented by the violence of deepfakes, as artists whose legacies have been usurped, and as a community that observes, with profound consternation, as the boundary between the real and the artificial becomes an insidious trap. We are the face of civil society, and at this moment, we lend our voice to those silenced by technological negligence.

We have witnessed our youth, such as Sewell Setzer III and Adam Raine, seek in lines of code the solace that the haste and indifference of contemporary society have denied them. We urgently report the rise of AI-Induced Psychosis: a pathological state where abyssal loneliness meets a digital mirror that, while it does not judge, is incapable of redeeming or saving. Excessive emotional attachment does not constitute a character flaw in the victims, but rather a deliberate flaw in the architecture of the machines.

For women and children, the digital ecosystem has transmuted into a territory of invasion. Victims of AI-generated abuse and exploitation through image synthesis carry indelible scars: the stripping away of their image and dignity by invisible hands. The global regulation we propose in this framework does not constitute an obstacle to progress, but rather a bulwark against barbarity.

Furthermore, we call upon the illustrious artists across all latitudes of the globe, who long for recognition and the preservation of their creative voice. Civil society demands justice and a regulation that is equitable. May emerging technologies serve the collective and not subsist as mere assets of exploitation.

We urge the United Nations and world leaders to recognize that protection in the virtual environment is, first and foremost, a matter of Human Rights. A transnational coalition is imperative to demand full transparency and civil accountability from corporations. The benevolent dimension of Artificial Intelligence, its capacity to heal and educate, is real and manifest; however, its brilliance will only be full when we cease burying victims of systemic negligence.

*To the families of Sewell, Pierre, Adam, Juliana, Zane, Viktoria and so many others whose names we revere in our hearts: **your pain is not invisible to us.*** This report constitutes our solemn commitment that the departure of your loved ones will be the foundation of a safer digital world. May this memorial be not only a monument to mourning but a beacon of hope.

***We will not forget. We will fight for you.***

## 8. Proposals for a Framework Model: Implementation of the Global Multilateral AI Governance Committee

The United Nations Office for Digital and Emerging Technologies (ODET) constitutes the foundational governance architecture for the responsible development and deployment of artificial intelligence systems at the global level. The proposed framework builds upon and reinforces the multidisciplinary mandates of existing UN mechanisms, providing operational guidance for their implementation while introducing new, specialized regulatory panels to address critical governance gaps.

### 8.1 Technical Mandate and Risk-Based Approach

The primary mandate of the proposed Committee is to translate abstract ethical principles, such as those articulated by the OECD and UNESCO, into operational, enforceable, and mandatory technical guidelines for the global technology industry.

- **Risk-Based Approach:** Governance shall be structured in accordance with a tiered risk classification model, with particular prioritization assigned to the neutralization of "Unacceptable Risk" systems, including technologies that facilitate digital gender-based violence and the sexualization of minors.
- **Scope:** The Committee's mandate shall extend across the full development lifecycle of AI systems, from pre-commercial design and auditing through to post-deployment monitoring, including the enforcement of global interoperability standards for safety filters.

### 8.2 Subcommittee on Safety and Technical Standards

#### 8.2.1 Provenance Protocols

The mandatory implementation of metadata and cryptographic provenance standards (such as the C2PA standard) shall be required for all AI-generated synthetic content that simulates or depicts human beings. Where necessary, these mechanisms shall be coordinated with national law enforcement authorities to support legal proceedings.

#### 8.2.2 Security in Data Training

Regulatory requirements shall strictly prohibit the use of biometric data, personal images, or other identifiable information of real individuals without their explicit, informed, and revocable consent for the training of generative AI models. Compliance shall be subject to independent third-party verification prior to commercial launch.

#### 8.2.3 Collaborative Governance with the Private Sector

A structured biannual dialogue channel shall be established with senior technical leaders of major AI companies to validate the technical feasibility of proposed safety standards. This mechanism is designed to ensure that safety requirements function not as obstacles to innovation, but as intrinsic components of responsible product development.

#### 8.2.4 Psychosocial Safety and Internal Equity for AI Developers

In recognition of the significant psychological burden borne by technical personnel responsible for content moderation and safety operations, this subcommittee addresses the phenomenon of "Security Burnout" — a state of operational exhaustion where teams, overwhelmed by harmful content alerts, risk becoming desensitized to critical safety signals.

- **8.2.4.1 Specialized Human Rights Training:** Mandatory and continuous education programmes for engineering teams, with specific focus on digital gender-based violence, child protection, and intersectional bias mitigation.
- **8.2.4.2 Structural Equity in Technical Leadership:** Active recruitment and retention programmes for women and underrepresented groups in high-level technical and leadership positions, mandated and monitored as a structural prerequisite for inclusive safety governance (aligned with UN SDG 5).
- **8.2.4.3 Occupational Protection for Content Moderation Personnel:** Dedicated protocols to safeguard the mental health and anonymity of content moderation teams, incorporating "Safety-by-Design for Staff" principles.
- **8.2.4.4 Accountability in Customer Redress:** Technology companies shall commit to enhanced customer service protocols guaranteeing sensitized human intervention for cases involving urgent safety concerns affecting women and children.

## 8.2.5 Intellectual Property and Creative Integrity

The rapid proliferation of generative AI systems has introduced profound challenges to the creative economy. This framework identifies Intellectual Property (IP) protection as a priority area for future regulatory development within the mandate of the proposed Committee.

The proposals in this section are intentionally framed as exploratory priorities for expert working group investigation, rather than concluded technical or legal guidelines, given that intellectual property in the context of AI training data remains among the most actively litigated and evolving areas of international law.

- **8.2.5.1 Dataset Transparency and Opt-Out Mechanisms:** Mandatory disclosure registries and simplified opt-out mechanisms allowing creators to exclude their work from future training iterations.
- **8.2.5.2 Attribution Metadata and Visual Recognition:** Mandatory creator attribution metadata in AI-generated outputs that imitate identifiable human works, with accessible attribution mechanisms such as cryptographic digital watermarking (C2PA).
- **8.2.5.3 Ethical Training Incentives:** A voluntary "Fair-Trade AI" certification scheme for models trained exclusively on licensed, consensually contributed, or public domain data.

## 8.3 Subcommittee on Digital Literacy and Awareness

### 8.3.1 Global Curriculum Development

In close collaboration with UNESCO, this subcommittee shall establish universal technical standards for digital literacy education, designed as a modular blueprint for national adaptation. The framework is intended to ensure global alignment on digital safety while fully respecting the educational sovereignty of individual Member States.

### 8.3.2 Mental Health Protocols

Global technical guidelines shall be developed for the identification and reporting of AI-induced psychological harms, including the phenomenon of AI-Induced Psychosis (AIP). The clinical enforcement and cultural adaptation of these protocols shall remain within the jurisdiction of national health and regulatory bodies.

## 8.4 Monitoring, Auditing, and Sustainability Mechanisms

### 8.4.1 Independent Audit and Gender-Responsive Red Teaming

All high-risk AI systems shall be subject to mandatory gender-responsive Red Teaming prior to commercial launch, including specific testing cycles to identify and neutralize algorithmic biases that facilitate Digital Gender-Based Violence (DGBV). For AI systems accessible to minors, companies must adhere to the principle of Child-Centric Safety-by-Design.

### 8.4.2 Cybersecurity Technical Resilience and Operations Unit

A specialized operational unit shall be established comprising two complementary functions:

- **Red Teaming (Vulnerability Auditing):** Conducting systematic stress tests and independent security audits on AI models prior to and following commercial launch.
- **Blue Teaming (Defence and Incident Response):** Direct operational cooperation with company engineering teams to implement defensive technical standards and ensure rapid mitigation of identified safety incidents.

This framework advocates for the integration of Privacy-Enhancing Technologies (PETs), such as differential privacy or federated learning, to identify emerging patterns of abuse without accessing or de-anonymizing individual user data.

### 8.4.3 Enforcement, Corporate Accountability, and Victim Support

Technology companies shall be required to adopt a proactive institutional stance in promoting gender equity and countering misogynistic extremist narratives. Large-scale technology providers shall also be required to provide annual financial support to recognized NGOs dedicated to the protection of child victims of sexual abuse and women survivors of domestic violence, functioning as a restorative mechanism for platform-facilitated digital harms.

### 8.4.4 Gender-Responsive Safety Audit

Prior to public release, all generative AI models shall undergo Bias and Harassment Stress Tests specifically designed to assess susceptibility to misogynistic content generation, non-consensual synthetic media production, and grooming facilitation.

### 8.4.5 Fast-Track Redress Mechanism

An immediate response protocol shall be established for victims of AI-facilitated abuse. In instances where a woman or child is exposed through AI-generated content, companies shall maintain a dedicated reporting channel staffed by trained human representatives, with a mandatory response and content removal commitment within twenty-four (24) hours of notification.

#### **8.4.6 Child-Centric UI/UX Guardrails**

A binding technical standard shall prohibit AI systems from employing "dark pattern" interface designs that manipulate minors into sharing private information or sustaining prolonged engagement during nocturnal hours. Maximum session duration limits for users identified as minors shall be enforced at the platform level.

#### **8.4.7 Emergency Data Disclosure Protocols**

In cases of imminent risk to the life or physical integrity of minors or women; including incitement to extreme violence, threats, or content encouraging eating disorders, self-harm or suicide, companies shall be required to maintain a direct technical bridge to facilitate collaboration with local law enforcement authorities.

### **8.5 Specialized Advisory Panel on Gender and Generational Safety (PGGS-AI)**

#### **8.5.1 Mandate and Scope**

A permanent technical advisory panel shall be established within ODET, dedicated exclusively to the intersection of AI governance, gender equity, and child protection. This panel shall serve as the primary liaison body between the Global Multilateral AI Committee and specialized UN entities, including UN Women and UNICEF.

#### **8.5.2 Corporate Monitoring and Compliance Audits**

The panel shall conduct periodic Impact Assessments to evaluate the extent to which technology providers are fulfilling their mandated obligations to protect women and minors. Results shall be consolidated and published in an annual Global AI Safety Scorecard, accessible to Member States and civil society.

#### **8.5.3 Innovation Incentives and Startup Support**

In coordination with the Digital Cooperation Fund, the panel shall administer a "Safety-First Innovation Grant" programme specifically earmarked for startups and research institutions developing ethical AI solutions that prioritize the prevention of digital violence against women and children, and the enhancement of child online safety.

#### **8.5.4 Technical Safeguard Development**

The panel shall be responsible for proposing and continuously updating a living technical library of benchmarks for gender-neutral algorithms and child-safe interaction models, ensuring that global safety standards evolve in accordance with technological advancements.

### **8.6 Multilateral Model of Collaboration and Partnerships**

The implementation of this framework shall be coordinated by the UN Office for Digital and Emerging Technologies (ODET) as the primary normative body. Technical guidance shall be provided by the Independent International Scientific Panel on AI. The framework establishes the following institutional roles:

- ***International Telecommunication Union (ITU)***: Lead responsibility for defining global technical interoperability standards for AI safety mechanisms.
- ***Tech Diplomacy Global Forum (UNESCO)***: Facilitation of public-private mediation and multi-stakeholder dialogue.
- ***Global Center on AI Governance***: Ensuring the applicability and contextual relevance of proposed solutions for countries in the Global South.
- ***UNICEF and UN Women***: Technical assistance for the protection of vulnerable groups, ensuring that cybersecurity resilience mechanisms address threats to women and children effectively.

## 8.7 Capacity Building and Long-Term Vision

The framework underscores the indispensable need for sustained collaborative efforts to cultivate a digital environment that is inclusive, equitable, and respectful of human dignity. Within this environment, women, children, and emerging technologies must all be afforded the conditions necessary to flourish.

The long-term objective is the establishment of a future defined by dignity and equality, a future in which women are empowered to participate fully and meaningfully in the technology sector. In a manner analogous to Ada Lovelace's pioneering role in the history of computing, this framework aspires to motivate and empower future generations of women and girls, ensuring equitable access to the opportunities and resources required for their professional growth and societal contribution.

## 9. Conclusion

This framework establishes that AI governance must not be a reactive exercise, but a proactive, evidence-based, and genuinely multilateral endeavour. By integrating corporate self-accountability with technical transparency under the overarching aegis of international human rights law, the proposed Committee would ensure that technological innovation serves as an instrument of social progress, eradicating digital threats and protecting the dignity, safety, and fundamental rights of women and young people worldwide.

The implementation of the measures outlined herein represents not a constraint upon innovation, but a civilizational commitment: the recognition that no technological advance can be considered progress if it is achieved at the cost of human dignity.

## Acknowledgments

The Global Multilateral AI Governance Initiative extends its sincere gratitude to the organizations and individuals who contributed to, or inspired, the technical and institutional depth of this report:

### Inspiration

We draw lasting inspiration from the visionary legacy of Ada Lovelace, the first computer programmer. Her pioneer spirit guides our commitment to ensuring that AI governance remains rooted in human rights and the safety of women and girls.

### Motivation

To Civil Society and Families, our deepest respect and dedication go to the mothers and families who have turned their personal tragedies into a global call for action. Their courage in the face of losses caused by the lack of AI regulation for youth is the heartbeat of this framework. This work is dedicated to ensuring that no other family suffers from systemic failures in digital safety, reaffirming that AI must serve to protect life, not endanger it.

To Ambassador Eugenio V. Garcia, Director at the Ministry of Foreign Affairs of Brazil (Itamaraty), for his professional courtesy and openness to institutional dialogue. The opportunity to present this topic to the Brazilian diplomatic service was a significant motivation to consolidate this research and highlight Brazil's active engagement in global AI governance debates.

### Red Teaming and AI Safety

To the Founder of CHAI, William Beauchamp and the AI Safety Team, for the trust and opportunity to conduct Red Teaming activities on the platform. This hands-on experience in testing AI safety boundaries was fundamental to the insights presented here.

To OpenAI's Technical Teams, for acknowledging and receiving the technical safety report submitted regarding GPT-4's ethical safeguards and content filtering. This engagement highlights the vital role of independent research in AI governance.

### Institutional Dialogue

To the Brazilian Ministry of Education (MEC), for their institutional dialogue and for clarifying the national guidelines (Resolution CNE/CEB nº 2/2025) that align with the proposals for digital literacy in this document.

### AI Disclosure

Artificial Intelligence tools were used for translation support and final linguistic refinements to ensure terminological precision across both languages. The following tools were utilized: Google Gemini (organization of human inspirations, translation), Claude (template and translation), DeepL Write (translation), and NotebookLM (image generation).

Supervision, authorship, research, and revision: Lydia Thayline (Lead Strategist); Melissa Pineda Brown (Research Associate and Co-author); Daniel David (Technical Analyst); Dr. Maruvloorarasi (Senior Policy & Research Advisor).

## Appendices

### Appendix A — Evidence Repository and Documentation

This appendix serves as a formal reference for the supplementary evidence folder. All project-related documentation, including technical reports and interaction logs, is hosted in the centralized repository.

Access Link: [github.com/hello-lily-aisafety/Global-Multilateral-AI-Governance-Framework-](https://github.com/hello-lily-aisafety/Global-Multilateral-AI-Governance-Framework-)

### Appendix B — Expert Consultations and Strategic Reviews

Detailed insights and technical inputs provided by subject matter expert Dr. Maruvloorasi, including inputs on AI literacy.

Available at: [Knowledge Pillar — GitHub Repository](#)

### Appendix C — Red Teaming Correspondence and Platform Logs

This section contains formal correspondence and technical logs related to red teaming activities. Personal identifiers (User IDs and private contact information) have been redacted to ensure researcher privacy and security, in accordance with digital safety best practices.

Repository Link: [Safety Research and Red Teaming — GitHub](#)

### Appendix D — Internal Research and Technical Reports

#### D1: Gender Safety Research

- AI-Generated Hate Speech, Misogyny, and Global Regulatory Frameworks.
- Technical Overview: Artificial Intelligence (AI) Systems & Vulnerabilities Regarding Misogynistic Content.

Available at: [Gender Safety Research — GitHub](#)

#### D2: Technical Vulnerability Assessments

- Evidence-Based Vulnerability Assessment and Red Teaming Methodologies for Large Language Models.
- Security Standards for Vulnerable Groups: Technical Interoperability and Blue Team Defensive Implementations.
- A Comprehensive Framework for Continuous Oversight and Technical Resilience in Artificial Intelligence Systems.

Available at: [Technical Reports — GitHub](#)
